

An Investigation of Clinical and Psychometric Techniques in the Study of Cerebral Dysfunction

Principal Investigators: William H. Biggers, M.D.
Charas Suwanwella, M.D.
Harry C. Holloway, LTC, MC

Assistant Investigators: Boonarb Panpanya, P.H.N.
Vacharee Jan-Aiem

OBJECTIVE:

1. Development of a clinically valid, brief Thai mental status questionnaire for measuring mental changes in conscious patients secondary to disruption of brain function by a defined neurosurgical lesion;
2. To describe the shifts in symbolic formulations concerning illness made by the patient and patient's family during the course of the patient's illness.

DESCRIPTION: See previous Annual Reports.

PROGRESS: No new work was done on this project during the last year. The data was returned to WRAIR in September 1969 for final write-up.
